VOLITI

AI Fat Loss Coach

Timely interventions that build self-management skills for lasting fat loss results.

The real challenge of fat loss isn't "not knowing what to do." It's failing to make consistent choices under stress, fatigue, and social pressure. Voliti is an AI coach that intervenes at the moments that matter, training users to build lasting self–management capability.

Dexter Yao · CEIBS | April 2026

01 · THE PROBLEM

Fat loss fails not from ignorance, but from moments of weakness

We interviewed ~35 real users across China and global markets, including Xiaohongshu, Reddit, and in-depth conversations. We found a universal struggle that crosses cultures and age groups:

> *"I know everything I need to know. I just can't control myself. I just need someone with me."*
>
> — Xiaohongshu user

> *"I already know this. Being consistent is the problem for me."*
>
> — Reddit r/loseit, "tried 40 times in 7 years"

Existing fat loss tools (calorie counters, fitness trackers, diet apps) all solve the "don't know how" problem. But what users actually lack is **someone to help them make the right choice when they're stressed, tired, or emotionally overwhelmed**.

6-8 Weeks

The typical breakdown point. After the honeymoon phase ends, most people quit.

5-10 Times

Average number of diet attempts by serial dieters. Each time they say "this time is different."

0

Existing products that deeply integrate AI with systematic behavior change methodology.

02 · THE SOLUTION

An AI coach that knows your patterns and shows up at the right moment

Voliti acts like a calm strategic advisor. It won't motivate you with streaks and rewards. Instead, it helps you see your own behavior patterns, prepares you for high-risk moments, and intervenes gently when you're about to drift.

01

Daily Coach Rhythm

Morning state check-in, micro-interventions at key moments during the day, evening reflection on today's choices. Three touchpoints that form a continuous behavior change process.

02

LifeSign System

Pre-set coping plans for vulnerable moments while you're clear-headed. "If I feel tired at 3pm and want snacks, then drink water and walk for 5 minutes first." Replace willpower with planning.

03

Temporal Awareness

The coach remembers your life timeline: last week's business trip, this Friday's dinner party, recurring weekend loss-of-control patterns. It predicts risk in advance, not after the fact.

04

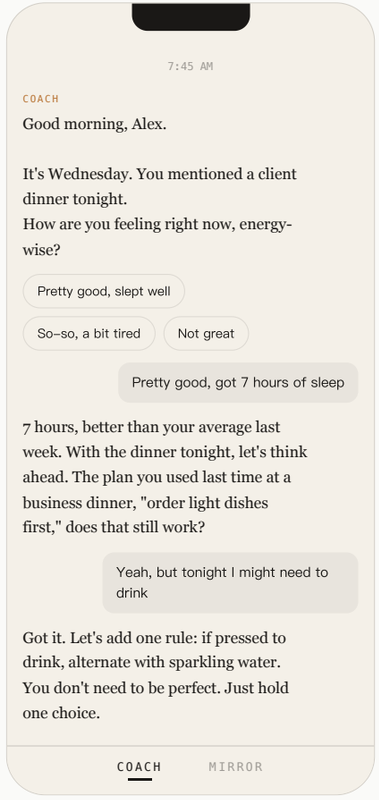
Witness System

When you hit a milestone, the coach generates a personalized commemorative card. Not a reward, but a record: "I saw what you did." Something to look back on during low moments and find strength.

03 · DAILY DIALOGUE

Your day, with a coach always by your side

Here's a typical day for "Alex," a product manager in his third week of coaching. The coach adapts its support based on his state and life rhythm throughout the day.



Scene: Morning Check-in

The coach knows about tonight's client dinner (temporal awareness) and proactively brings it up, linking to an existing plan. Instead of waiting for a post-failure analysis, it helps the user prepare ahead.

Key Design Choices:

- The coach's tone is "strategic advisor," not fitness trainer
- References the user's own past successful plans, not new advice
- "You don't need to be perfect. Just hold one choice." reduces mental burden

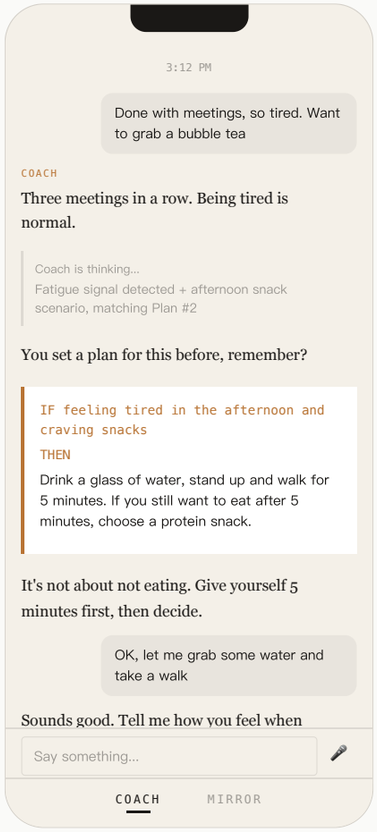
04 · CRITICAL MOMENT INTERVENTION

3 PM. The moment fatigue hits.

3 PM is Alex's recurring vulnerable moment. Three meetings back to back, brain fried, automatically thinking about the cake at the cafe downstairs.

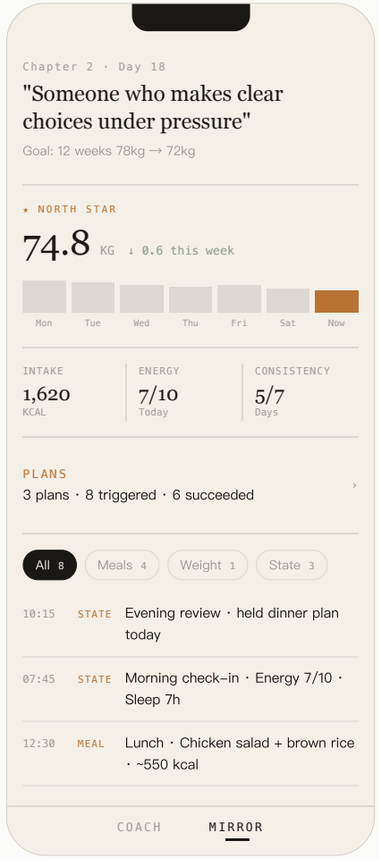
At this moment, the coach won't wait until he finishes the cake to say "you went over today." Instead, it gently surfaces his pre-made plan right when the craving hits.

> **Why this moment matters:** Users lose control not because they don't know what to do, but because under fatigue/stress, the brain automatically picks the path of least resistance. The coach's job is to offer an alternative at the exact moment "autopilot" kicks in.



MIRROR:
Your self-awareness dashboard

MIRROR is not a conventional data dashboard. It's ordered by importance top to bottom: who you are, your key metric, your actions, what happened today. The first thing you see is your identity statement, not a weight number.



Information hierarchy, top to bottom:

1. Identity statement: "Who I am"
2. North Star metric: One key number + 7-day trend
3. Supporting metrics: Today's snapshot
4. LifeSign system: Plan execution status
5. Event stream: What happened today

"Consistency" over "perfection": 5 out of 7 days on target this week. The coach won't say "you missed two days," but rather "5/7, that's progress."

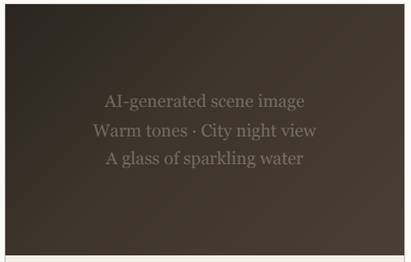
06 · WITNESS MOMENTS

Being seen,
not being rewarded

When a user achieves a milestone, the coach generates a Witness Card, a personalized commemorative card.

This is not a "congratulations, you earned a gold medal" gamification reward. It's the coach saying: "I recorded what you did." Psychology research shows that informational feedback supports intrinsic motivation, while controlling rewards erode it.

> **High-value scenario:** The coach discovers progress the user hasn't noticed themselves (e.g., consistent weekday breakfast structure for three weeks straight), and proactively generates a Witness Card. This experience of "being seen" is the core value of the coaching relationship.



April 2, 2026 · Chapter 2

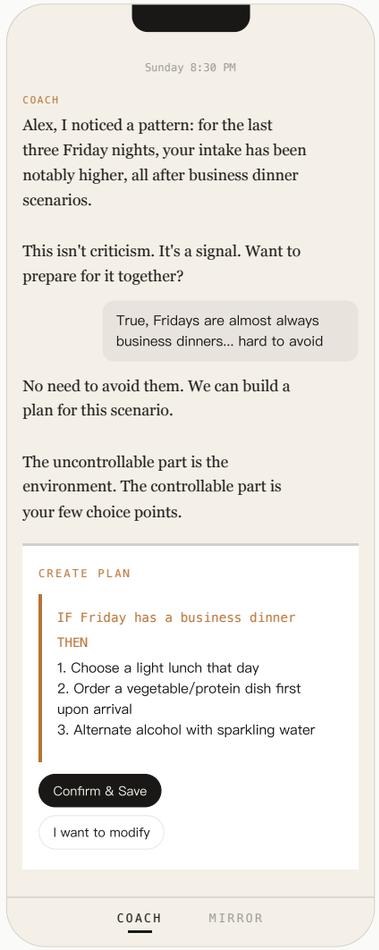
Alex, tonight at the dinner you chose sparkling water.

That wasn't an easy choice. You said business dinners are the hardest moments to hold the line. But you held it. Not through willpower, but because you planned ahead and executed on site.

This is what you've been practicing: making clear choices in complex environments.

VOLITI · WITNESS

Not willpower.
Pre-made plans.



Scene: Pattern Recognition → Plan Creation
After detecting a three-week Friday pattern, the coach doesn't say "you eat too much on Fridays." Instead: "This is a signal. Let's prepare."

Plan Lifecycle:
1. Coach detects pattern → proposes creating a plan
2. User and coach co-create the plan (user has edit rights)
3. Next time it triggers, the coach proactively reminds
4. Post-execution tracking of effectiveness
5. Ineffective plans get iteratively revised

Psychology research shows that "if-then plans" (implementation intentions) are far more effective for long-term behavior maintenance than action plans alone. The key: prepare for vulnerable moments while clear-headed, replacing on-the-spot willpower consumption with pre-made plans.

08 · USER VALIDATION

Who needs this product

We identified four core user segments. Their shared trait: they don't lack knowledge. They lack execution support at critical moments.

~40%

Execution Strugglers

"I know what to do, I just can't do it." Knowledge workers whose habits break due to travel, overtime, and social obligations. Need minimum viable consistency.

~30%

Emotional Eaters

"I know what triggers me, but I can't stop." Use food to process anxiety and boredom. Need to be understood, not judged.

~20%

Serial Dieters

"This time is different... until it isn't." Average of 5–10 diet attempts. Need someone to help them see recurring failure patterns.

~10%

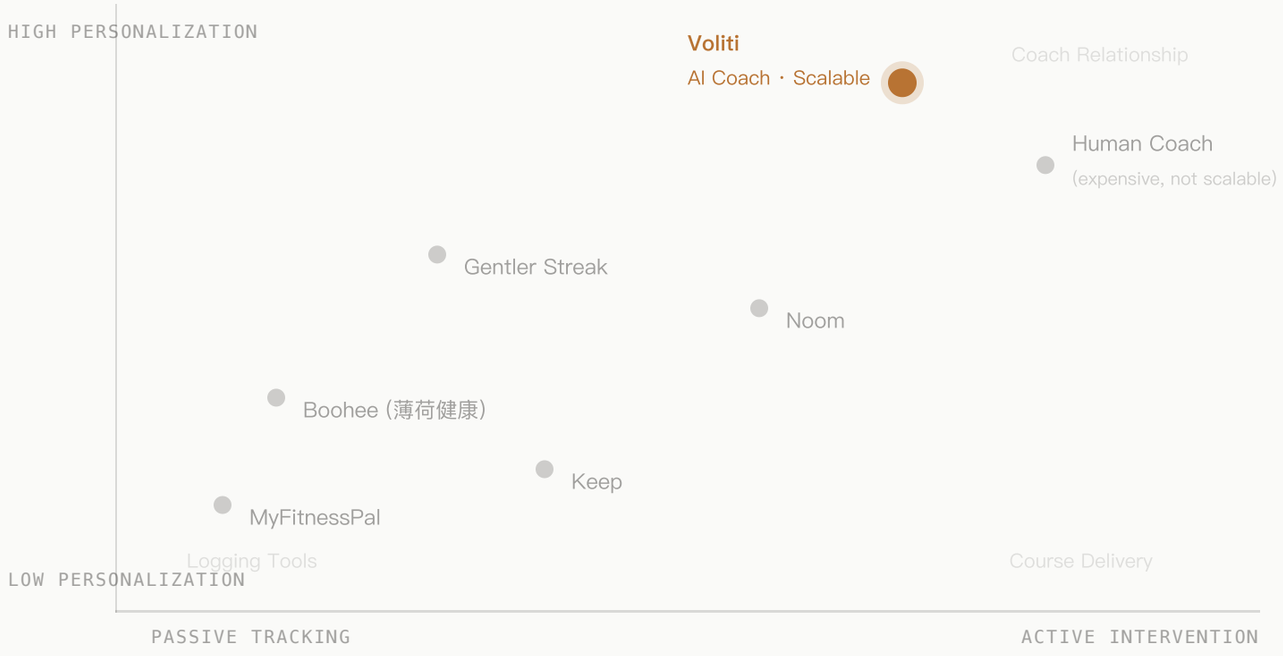
Maintenance Challengers

"I did it, but I don't know if I can keep it." Already lost weight, but maintaining is harder than losing. Need to shift from dieting mindset to lifestyle mindset.

09 · MARKET POSITIONING

Competitors are solving the wrong problem

Existing fat loss products cluster in the bottom-left quadrant: passive tools with low personalization. No product is truly doing "personalized coaching interventions at critical moments."



Voliti is positioned as **human-coach-level personalized intervention**, made scalable through AI. Users get not a logging tool or course delivery system, but a coach that truly understands their behavior patterns and proactively shows up at critical moments.

How it works

Voliti has three layers: the user faces a coach conversation on their phone, backed by a continuously running AI system.

USER LAYER

iOS App

The user's only interface. Two views: COACH (dialogue) and MIRROR (data reflection). Local storage ensures offline availability.

COACH LAYER

AI Coach Agent

The core engine. Understands conversation context, identifies behavior patterns, manages the LifeSign system, and delivers timely interventions. Built-in behavior change methodology.

Analysis System

Background process that periodically scans user timelines, identifies cross-week behavior trends and high-risk patterns, and generates summaries for the Coach.

DATA LAYER

Behavior Log

Every meal, state check-in, and weight record stored as event files with timestamps, context, and raw evidence.

Timeline

Bidirectional timeline: retrospective behavior patterns + prospective upcoming life events. The coach's temporal awareness is built on this.

Plan Library

User's LifeSign plans with trigger conditions, coping behaviors, and success rates. Continuously refined through usage.

> **Key Design Principle:** The user only faces one coach. All analysis, pattern recognition, and data processing happen behind the scenes. What the user experiences is a calm, steady, understanding conversation partner.

SUMMARY

Making change a continuous process, not a willpower sprint

Focus

Not an information encyclopedia. One job: help users hold their choices at critical moments.

Companionship

Not a cold tool, but a coach who knows your patterns and stays by your side.

Long-Term

Not chasing 21–day quick fixes. Building self–management capability that runs for a lifetime.
